

All Saints is a disused Saxon church, cared for by The Churches Conservation Trust, set up in 1969 to preserve churches no longer needed for worship, but with historic, architectural or archaeological importance.

2003: The tall female yew, growing south of the church, has split into two fragments. Its thin foliage is supplemented by plentiful new growth. Each fragment is thin skinned and horse shoe shaped, separated at the ground by a gaps of 3' 2" and 1' 10".

Girth:

2003: 27' 5" close to the ground; 28' 7" at 3' - Tim Hills

2006: 875cm (28' 8") at 1.5m; 850cm (27' 11") at 0.3m. - Jack Oliver - Tree Register's Wiltshire recorder

2012: 27' 9" close to the ground (one rusty bent over nail marks the position); 28' at 1'; 28' 2" at 2'; 28' 7" at 3'. Other nails had been removed, the stained outer bark indicating where these had once been hammered in. Height of girth recordings taken from the ground nearest the church. Peter Norton
