Two old yews are recorded here. Tree 1, growing SE of the church, is veteran. It is female with a thickened horse shoe shape and a gap 15" wide that closes over at a height of 6'. Inside the hollow space is a distance of about 3' to the back of the tree. The bole has been much trimmed in the past and is very knobbly. From it rises a fluted main branch. In 2001 large amounts of twiggy growth hid the bole, but much of this had been removed by the time I photographed the tree in 2014.

Girth 2001: 20’ 5” at the ground, 18’ at 3’ and 17’ 8” at 5’.

Girth 2014: 21’ 1” at the ground and 18’ 5” at 5’.

photos - above 2014 (Tim Hills) below 2016 (Paul Wood)
Tree 2 on the plan is a notable yew which grows north of the church. It is female and has particularly red, flaky bark. Three large lateral branches had been removed at a height of 5'6", one of these with a circumference of 7", and this has encouraged the tree to grow upwards rather than outwards. I recorded a girth of 13' 7" at 1' in 2001.

photos - above 2014 (Tim Hills) below 2016 (Paul Wood)
Tree 3, 4 and 5 are much younger. They are seen here in 2014, recovering from the removal of most of their branches.
