

This site was visited by Peter Andrews in 2007 and 2011 and by Peter Norton in 2010. Four yews grow here, the largest is female and was described by Peter Andrews in 2007 as a pollarded yew with an estimated girth of 17' 6". When he returned in 2011, elder had been cleared enabling the yew to be more closely assessed. After measuring in several places he recorded its lowest girth as 19' 0" at 1'. It grows right on the edge of the churchyard south of the church and permission was needed from the owners of the adjacent land (the old Abbey site) to be able to measure it. The Abbey site now houses the old vicarage and its large garden.

In 2010 Peter Norton was unable to measure the yew due to thick ivy and summer vegetation. Dense ivy was also noted in its crown.

The 2nd significant yew grows only a few metres away. It was recorded by Peter Norton in 2010 as partly hollow with an internal stem. He recorded a girth of 13' 10" at 2' from the top of the mound;

2010 Peter Norton

2011 Peter Andrews

Two further yews grow here, a female by the east gate with a girth of 9' at 1' and a male with a girth of 12' 9" at 1'.
