

Nothing seems to be known of the early history of this church.

The trees were first reported in the 1970 Brecon Yew Survey, which overstates their girths at 17' 8", 20' 4" and 18' 9".

In 2000 the three male yews growing in a line south of the church were each covered in vibrant green foliage. The largest girthed, seen here on the left was 16' 8" at 2'. It is a hollow horse shoe shaped tree with about  $\frac{2}{3}$  of its shell remaining. The tree seen right, with similar characteristics, girthed 15' 4" between the ground and 1'.

A circular wall surrounds the smallest girthed of the trio. It was possible to step into the centre of the tree and see 3 main areas of growth that are all connected. The most substantial of these leans away from the church almost at right angles.
