

2006: Almost east of the church on top of a very steep mound is a hollow female yew with unusually shaped internal growth. Girth was approximately 15' low on its trunk. This would be higher if including the stump of a piece of the tree that has been removed.

SSW of the church is a male yew contained within a 3' high wall. Girth was 15' 11" approximately 18" above the wall height. The tree consists of numerous stems around its entire girth. Some remnants of the original trunk were visible.

Due south of the church by the path is a piece of yew stump about 8' in girth, but resting on a much larger base perhaps up to 16' in girth.
