

2000: This male yew with spreading roots grows west of the church. A more recent stem has formed at the edge of the main trunk and is joined to it for 3'. It will be interesting to see how these two develop during the next two hundred years.

Small 'windows' into the bole reveal that hollowing is taking place. Lateral branches are small, foliage sparse, and ivy covered one side of the bole.

Girth:

2000: 19' at 5' (upper slope); 17' 4" excluding the new trunk - Tim Hills

2011: 19' 5" at 2' measured around the complete tree - Peter Norton

A second male yew, passed on the way into the churchyard, has a clean and straight bole with a girth of 12' 3" at 2'.
