

2006 (left) The yew grows NW of the church. It was ivy filled and hard to get close to, but had clearly been considerably larger than the 11' girthed fragment that makes up the tree. When a piece of nearby yew stump is added, girth becomes closer to 16'. Internal growth could be seen in the fragment.

In 2010 the area around the tree was much clearer and Peter Norton was able to take the photographs below that clearly show this to be half of the original tree.
