

2007: Two yews, male and female, grow side by side SW of the church.

The male is hollow and leaning. The space around the tree was a tangle of elder and brambles, hiding ground littered with rocks and rubble. Many of the young branches were of similar age, suggesting a tree that has been severely cut back in the past. Girth was approximately 16'.

The female yew is seen below, though a Mountain Ash that had taken root in the centre of the tree is not visible in the photos. Large areas of dead sapwood can be seen and when hollowing is complete and the sapwood has decayed it will leave a tree similar to the examples seen on the next page at Holne and Heyope.

Girth of the yew, which has been larger, was 14' 1" at the ground and 14' 3" at 2'.

The yews at Holne and Heyope
