

This is the largest of several yews in the churchyard.

2007: Dave Kenny recorded a girth of 388cm at 100cm (12' 9" at 3' 3").

2013: Peter Norton recorded and photographed the male yew which grows just southwest of the south porch on a small mound. It has lost some of the outer bole on the north side of the tree and more will follow in time leaving a horseshoe shape. Small internal roots were observed and there was some concrete infill in the two basal cavities on the south side of the bole.

Girth was 12' 10" at 2' 6", measured from the ground on the west side.

To the southeast of the porch a partially hidden female with a girth of 8' 10" was also noted.
