

In 1999 this male tree had a girth around its base of about 14'. It leans heavily towards the church. The photos taken in 2015 explain why it could not be remeasured.

Many branches emerge at a height of about 4', where the large gap closes over. In this gap, which is about 2' across, can be seen many internal root and stems. The tree had plentiful green foliage, but also many brown leaves.

A 2nd yew was photographed after the removal of ivy. It grows by the south perimeter wall, which it will eventually and inevitably damage. Girth was about 8' 6".
