

The 1970 Brecon Survey listed two yews with girths of 15' 7" and 12'.

2002: Both trees are female, the larger of the two (left) grows NE of the church. Its girth was 15' 9" at 3'. The smaller (right) grows east of the church, and measured 11' 10" at 5'. In spite of its relatively small girth it is a fully developed horse shoe shape with a thin shell.

photos taken by Geoff Garlick in 2004

Paul Wood 2015:

The cast iron fence that bounds the public footpath through the churchyard was chained and locked so there was no access to the smaller girthed yew in the southern area of the churchyard.

The veteran yew is puzzling. Its dull grey wood with no sign of twiggy growth and thin foliage gave it an appearance I am not familiar with in yews. Girth was exactly 16' (4.88m) at 3'.
