

This ancient yew was unrecorded until Lin Carter discovered it in 2012. I visited in the same year and recorded the male yew growing west of the church. It consists of two trunks joined close to the ground, where girth was 20' 9". A storage shed had been built near to the tree and the ground was strewn with tombstones and rubble.

The two trunks have the appearance of well developed sections of a tree that was once larger still. The larger fragment, on the west side of the tree, had a girth of 14' 1" close to the ground. The smaller section, girthing 10' 4", had been allowed to become overwhelmed by ivy which grows high into its branches.
