

The church lies within a raised and extended churchyard, described in 1996 by the Clwyd/Powys Archaeological Trust as a 'small sub-triangular churchyard' with two mature yews.

The most significant of these is male, measured c1987 by Ann Nethercott who recorded girths of 31' 9" at 3' and 35' at 4'. These measurements were sent to the Conservation Foundation as part of a project associated with the Country Living magazine. In 1994 a girth of 37' was recorded in Meredith's *Gazetteer* in *The Sacred Yew*.

The huge fragment is seen below in 1998

The next photographs show the many different faces of this tree in 2015

A second yew, female, grows at the boundary of the churchyard and two adjacent gardens. It is recorded in Meredith's *Gazetteer* in *The Sacred Yew* (1994) with a girth of 22'.

It is seen on the right in 1998, the space between its many fragments filled with wood and other rubbish. This was gone by 2015 and the photos below show it to be a fine tree of many linked fragments.
