

2011: The name 'Ewyas' is considered to derive from the British Yw-ys, the Yew-place. Two yews grow south of the church. The larger girthed (A) is recovering after the removal of large quantities of ivy which had been allowed to grow high into its canopy. A large number of branches had been removed from all parts of the tree and for the moment foliage was thin. Girth was 16' 1" at 1'.

The smaller girthed yew (B) has a fuller crown. Its truncated original stem can be seen in the centre of the tree, with new branches growing around it. Girth was 12' 9" at 1'.

2016: Paul Wood recorded (A) with girth of 16' 1" at 1', noting twiggy growth on its bole and ivy beginning to take hold in the lower canopy.

The smaller girthed notable yew was measured at 1' and a girth of 12' 10" (3.91m) was recorded. There had recently been a major bole trim.
