

1998: This hollowing male yew grows SSW of the church. It has no leading branch, more an explosion of smaller branches from 5' and upwards, seen clearly in Geoff Garlick's photos taken in 2003. This is perhaps the tree's response to the loss of two major branches, whose white wood remains were still visible. Girth swells by 6' between the ground and 3', from 15' at its narrowest near the ground to almost 21' at 3'.

In 2017 Paul Wood found a churchyard where 'all is truly cared for'. The yew, which looked fine, was in the advanced stages of hollowing with a 3' opening on the north side and two smaller on the east and south sides - a yew that will one day appear as three fragments. Girth at the ground was 15' 7" (4.75m).
